STATINTL

STATINTL

I. GENERAL: The electrical design for Transmitter Facility [REDACTED]

[REDACTED] covers Transmitter Building and Gate House including the installation of government furnished 200 KW diesel engine driven generator sets with switchgear; interior work including power, lighting, control, grounding system, fire alarm, and outlets, conduit, terminal cabinet, cable tray and floor trench system for telephone, intercommunication and technical equipment wiring by others; and exterior work including extension to existing primary power distribution, protective lighting, secondary power service to Gate House and provisions of duct sleeves under roads and paved area for antenna cables by others.

II. DESIGN CRITERIA:

a. Request for Proposal on Design, POOGM letter of 15 March 1966 with the following attachments:

STATINTL

1. Using Agency Sketch Drawings:

No drawing number	[REDACTED]
Dwg. No. D5345-T/D-01,	Interior Grounding
Dwg. No. D5020-T/D-01,	Exterior Grounding
Dwg. No. D5341.02-T/F-01,	Floor Plan
Dwg. No. D5345-T/CL-01,	Plot Plan, Transmitter Site
Dwg. No. D5345-T/E-01,	Bus Duct & Power Panel Locations
No drawing number	Government Furnished Electrical Equipment

2. Scope of Work.

3. POD Comments on the Scope of Work, dated March 1966.

4. Description and Analysis of Electrical System (System 5).

b. Scope of Work attached to and made a part of Contract No.

[REDACTED]

c. Using Agency Information, Ref: POOGM letter of 9 April 1966 with the followings:

1. T.M.C. Power Distribution, Inc. drawings for 200 KW engine generator set,

Dwg. No. 15554-C,	Radiator Shroud & Guard
Dwg. No. 15342-C,	Lockout for Shockmounts
Dwg. No. 15587-B,	Mounting Detail
Dwg. No. 15549-B,	Battery Charger Wiring Diagram
Dwg. No. 155751-B,	Battery Charger 2412-52
Dwg. No. 15426-C,	Standard Engine Wiring Harness
Dwg. No. 15520-D,	Schematic
Dwg. No. 15770-D,	Assembly Drawing
Dwg. No. 15416-D,	Assembly Drawing
Dwg. No. 15589-D,	Storage Battery (Ordnance)
Dwg. No. 17016-D,	Wiring Diagram
Dwg. No. 15755-D,	Cabinet & Door Layout
No drawing No.	Point to Point Wiring Diagram

2. Installation and Maintenance Manual,
Granger Associates Model 747L antenna.

3. Using Agency Sketch Drawings, same drawings listed in design criteria reference a.l. plus the followings;

Dwg. No. D5345-T/S-01,	Heat Load
Dwg. No. D5345-T/S-02,	Antenna Cable Tray System
Dwg. No. D5345-T/S-03,	Transmitter/Exciter Cable Tray System
Dwg. No. D5345-T/S-04,	Signal Cable Tray System

Item	Design Analysis Summary	Checked	Date 18 Jan 1968

III. DESIGN RESUME:

Generally, five basic design pointers were considered in the electrical system layout such as safety capacity, flexibility, accessibility and reliability.

Circuit design will conform to the requirements of the National Electrical Code.

Circuit loading is generally 20-ampere, 2-wire, 120-volt for lighting and receptacles.

In all cases, loading of circuit will not exceed 80% of the branch circuit rating.

Branch circuits and feeders overcurrent protection will be rated 25% greater than the load rating, but shall not exceed 150% of the load.

Specific rules for fuse and circuit breaker setting and coordination of the National Electrical Code will be followed.

Basic limitations on voltage drop for this design will be:

3% for feeders or sub-feeders from transformer to lighting or power panelboards.

2% for branch circuits to lighting or power loads.

Motor circuits will be 2 & 3% of the above respectively.

The number of lighting and power branch circuits will be based on the final load requirements of the building.

Item	Design Analysis Summary	Checked	Date 18 Jan 1968

STATINTL

Electric power will be derived from plug-in bus duct at 240 volts. 3-phase generators are GFM and will be wired for complete integration with [redacted]

Building utility load power will be 120/208 volts derived from a 150 KVA dry type transformer except for air conditioning equipment.

Grounding is a stringent requirement of this project. Design is prepared in accordance with the using service grounding requirements and the National Electrical Code.

There will be two separate grounding systems though it is realized that a single grounding source is generally always used for grounding both the system and equipment.

The building system neutral will be grounded at the power entrance cubicle located in the power room and tied to the transformer secondary ground.

All metal throughout the building such as reinforcing steel, steel cabinets, panelboards, antenna switches, hardware, cable shields, etc. will be physically bonded together and connected to the grounding grid or peripheral ground wire or indicated on the drawings.
